

Capture Input Signals Shorter Than the Cycle Time

- This Input Unit can read pulse inputs that are shorter than the cycle time of the CPU Unit.

CJ1W-IDP01

Features

- A pulse width (ON time) of 0.05 ms min. can be read by the Quick-response Input Unit.
- Input data read by the internal circuits is cleared when inputs are refreshed.
- Quick-response Input Units can be used when communicating with inspection equipment to read the many pulse signals that are too short to be read with normal I/O Units.
